Colorado Total Health Cost and Geographic Study

Introduction and purpose of study:

The Colorado Division of Insurance (DOI) set forth a proposal for health actuarial services in December 2013. The proposal was to perform an actuarial study of Health costs in the state using the Colorado All Payers Claims Database (APCD). The APCD is administered by the Center for Improving Value in Health Care (CIVHC). Miller & Newberg Inc. (MN), Consulting Actuaries, was awarded the contract. This report adheres to Actuarial Standards of Practice (ASOP's), in particular ASOP 5 (Incurred Health and Disability Claims), ASOP 23 (Data Quality) and ASOP 41 (Actuarial Communications).

The purpose of the study is to:

- Review the Total Health Cost for Commercial Major Medical and Pharmacy products in Colorado. The review is to be developed in such a way that costs can be analyzed by many segments including cost per service, utilization, claim categories, and cost by geographic location
- Review current and optional geographic rating regions;
- Develop the study with the intent for ongoing monitoring of health cost trends and geographic health costs;
- Assist the state with the review of rate filings (Major medical and pharmacy; individual, small group and large group)

This report's focus is on the first two bullet points.

Report Summary

The Total Cost section of the report focuses on cost by many segments (cost per service, utilization, claim categories, and cost by geographic location). Refer to that section and appendix for detail.

The next section focuses on geographic rating regions. A high level summary is provided here. Under the ACA, a state has the option to default the rating areas to the Metropolitan Statistical Areas (MSA) plus one Non-MSA for all other areas (refer to this as MSA + 1). The state has the option to expand upon those areas as long as the regions:

- are actuarially justified;
- are not unfairly discriminatory;
- reflect significant differences in health care unit costs;
- lead to stability in rates over time;
- apply uniformly to all issuers in a market;
- and are based on the geographic boundaries of counties, three-digit zip codes, or metropolitan statistical areas and non-metropolitan statistical areas.
- Must be actuarially justified if other than MSA + 1 is used. In the case of Colorado, this will lead to increased transparency in health costs.

Colorado Total Health Cost and Geographic Study

In order to justify geographic regions, MN used the four metrics as listed below.

Metric	Primary Applicable Component of Law	Primary Applicable Component of Law
Credible Membership	All	All
Stability in Utilization patterns (migration patterns)	Lead to Stability in rates over time	All
Standard Deviation/Variability of Total Cost	Not Unfairly Discriminatory	All
Cost per Unit	Reflect significant differences in health care unit costs	All

The DOI has asked MN to consider 5 possible regions, including the current, in the geographic study.

The regions considered are:

- 7 MSA + 4: current 2014 rating regions
- 7 MSA + 2: new west region combines current Resort + West
- 7 MSA + 1: combines all current Non-MSA regions into one (ACA default)
- RCCO regions: Regional Care Collaborative Organization Regions (see exhibit 13)
- 6 MSA + 2: Remove Grand Junction as MSA and combine with west region

The results of the scorecard finds 7 MSA + 4, 7 MSA +2 and 7 MSA +1 as acceptable geographic regional groupings, and ranks 7 MSA + 4 as the best grouping, followed by 7 MSA + 2 and then 7 MSA + 1. RCCO and 6 MSA + 2 failed as acceptable groupings.

Details of the ratings are illustrated in the table below. Further detail is provided in the body of the report.

(remainder of page intentionally blank)

Colorado Total Health Cost and Geographic Study

Geographic Rating Region Score Card (Rank each category, 1 = best score)

Metric and ACA Geographic Law Component	Metric	Credible Membership	Stability in Utilization Patterns ¹	Standard Deviation of Total Cost	Cost per Unit Factor	
	Primary Applicable Component of Law (In general all apply)	All	Leads to Stability in rates over time ¹	Not Unfairly Discriminatory	Reflect significant differences in health care unit costs	Acceptable Grouping
Rank (Score) - Description	7 MSA + 4	2 - Northeast region is the only region that does not have high credibility	1	1	1	Yes
	7 MSA + 2	1 - All regions have credible member months	2	2 - Slight Increase in disparity measurement when Resort is combined with West	2 – Unit cost varies reasonably between the 4 Non-MSA’s. More variation in units cost occurs with combining regions	Yes
	7 MSA + 1	1 - All regions have credible member months	3	2 - Slight Increase in disparity measurement when combining regions	3 – Unit cost varies reasonably between the 4 Non-MSA’s. More variation in units cost occurs with combining regions	Yes (Default ACA)
	6 MSA + 2	1 - All regions have credible member months	4	Fails test. Slight increase in variability from 7 MSA + 1, however, Grand Junction is credible on its own with a very high migration rating. Grand Junction should stand on its own.	Not considered, fails other test	No
	RCCO	1 - All regions have credible member months	Not considered, fails other test	Fail test - Disparity measures increase too much when compared to other regions	Not considered, fails other test	No

1 - Members within each region utilize providers within that region at a high rate which leads to stability. However, for each non-MSA region, utilization patterns vary significantly for providers outside of the members region leading to instability. Therefore the rank drops as non-MSAs are combined.

Colorado Total Health Cost and Geographic Study

Total Cost: Summary of Methods and Data:

Claims data were provided using the APCD. CIVHC provided 16 files with a total of 816 Million lines of data. The files contained data for medical claims, pharmacy claims, provider information and member information. Strict HIPAA compliance procedures were in place to ensure adherence to privacy regulations.

The data provided included the following products: commercial major medical + pharmacy, major medical only, pharmacy only, indemnity products, supplemental medical products, Medicare advantage, Medicare Part D and Medicaid. The study applies to commercial major medical + pharmacy products, so only members with those benefits were studied. The data include carriers with complete claims data and carriers with incomplete claims data, only those with complete claims data were reported, we use the phrase “complete carriers” to reference this group. The Non-MSA regions are highly represented by the complete carriers, so results are credible when comparing Non-MSA regions.

Data were also compiled and reported in a manner that is consistent with how these products are priced. Health insurance premiums are determined by when services are rendered (service date). This is very often different to when the services are paid for (paid date). It is common for a claim to be paid 1 – 3 months after it’s occurrence (lag payment). In some cases, however less frequently, claims are paid 4 – 24 months later. When insurance premiums are determined, the claims driving those premiums must be adjusted for estimated lag payments, this is sometimes referred to as “actuarial completion”. Data were provided with paid dates through March 2013. There is sufficient data to predict actuarial completion (and therefore Total claims) for the year 2012. Data is not sufficient enough to predict 2013 costs, so 2013 was not reported on. Claims in 2011 were increased 0.1% and claims in 2012 were increased 1.6% to account for completion. Total cost is defined as health expenses paid for by the carrier plus expenses paid by the member in the form of deductibles, coinsurance and copays. See Exhibit 1 for detail. For further detail on completion see appendix 2.

Exhibit 1: Modeled data and completion adjustment

Service Year ¹	Total Members	Total Member Months	Total Cost (Billions)	Actuarial Factor to Complete Annual Claims	Actuarially Completed Total Cost (Billions)	Total Cost per Member per Year ²
2010	644,565	6,108,616	\$1,717	0.0%	\$1,717	\$3,373
2011	593,725	5,699,940	\$1,632	0.1%	\$1,633	\$3,438
2012	576,480	5,454,472	\$1,591	1.6%	\$1,616	\$3,555
2013	474,821	1,338,353	\$341	Not credible for study purposes		

1) Claims provided with claim paid dates through March 2013. Service date is quite often different than paid date. Many claims that were paid in 2013 were for service dates in 2012. Data was analyzed on a service date basis as this is how insurance premiums are determined.

2) Total Cost per Member per Year calculated by weighting how many months the member is present during the year. Total Cost per member per year = (Total Cost / (Total Member Months)) X 12.

Colorado Total Health Cost and Geographic Study

Data were compared to benchmarks. The benchmarks include 2012 data from Colorado 2013 public rate filings and results from the 2012 Health Care Cost and Utilization Report developed by the Health Care Cost Institute (HCCI). HCCI performs a detailed claim cost and utilization report using carrier data for employer sponsored insurance (ESI) across the country (www.healthcostinstitute.org). See Exhibit 2 below for detail.

Exhibit 2: 2012 Total Cost Benchmarks

Description	Total Cost
This Study (APCD Individual and Large Group; Major Medical + Pharmacy Benefits; Complete Carriers)	\$3,555
Colorado APCD Website ¹	\$2,708
Colorado Public Rate Filings Small Group (Complete Carriers)	\$4,515
Colorado Public Rate Filings Individual (Complete Carriers)	\$2,261
Colorado Public Rate Filings (Individual + Small Group; Complete Carriers)	\$3,614
Colorado Public Rate Filings (Individual + Small Group; All Carriers)	\$3,464
Health Care Cost Institute: Northeast (Employer Sponsored Plans)	\$4,868
Health Care Cost Institute: Midwest (Employer Sponsored Plans)	\$4,735
Health Care Cost Institute: South (Employer Sponsored Plans)	\$4,790
Health Care Cost Institute: West (Employer Sponsored Plans)	\$4,382
Health Care Cost Institute: Total (Employer Sponsored Plans)	\$4,701
<p>1. The differences between the APCD website value and the study value is: APCD reports on claims per member per year, this study reports on claims per member adjusted for how long the member was present in the year. The study restricted the choice of plans to be those similar to ACA exchange plans, commercial major medical insurance with Medical and Pharmacy Benefits. APCD website value includes other types of insurance such as supplemental and indemnity plans and plans that only include Medical or Pharmacy, but not both.</p>	

Data were adjusted for age gender impacts. Age/gender factors provide an index for the cost due to age and gender. As an example, health care costs gradually increase as a member ages, so age/gender factors increase with age. It is appropriate to adjust for age/gender as this is input into geographic factor determination and in effect, treats all regions as if they have the same demographics. As an example, Denver Region total cost is \$3,492 for 2012 and Denver age gender factor is 0.997 (99.7% of Colorado's average – implies, among other things, that Denver has most likely, a slightly younger population). The appropriate cost to report is $\$3,492 \div 0.997 = \$3,502$. The Resort region, on the other hand, has an older than average population with 2012 total cost \$4,998 and an age gender factor of 1.043 (104.3% of the average). The appropriate cost to report is $\$4,998 \div 1.043 = \$4,792$. Data in this section are reported by current geographical area (exhibit 3). See exhibit 4 for age/gender factors by region. Exhibit 4 illustrates that the population studied has total cost increases, due to demographic changes, of 0.8% in 2011 and 1.0% in 2012. For every portion of this report, excluding this paragraph, total cost will imply age gender adjusted total cost. Exhibits 5 – 9 provide tables and charts summarizing total cost by current region.

Colorado Total Health Cost and Geographic Study

Exhibit 6: Total Cost adjusted for Age/Gender (Chart View)

Colorado Total Health Cost and Geographic Study

Exhibit 7: Total Cost as a Percent of Average

Exhibit 8: Total Cost by Category

Colorado Total Health Cost and Geographic Study

For a region (or county) to be credible to stand on its own it must have a large enough membership base providing more stability in health cost. Credibility in health care is very often measured through member months. Here we define credibility to be the number of member months required in a county, such that the total cost in that county remains stable over the three year period. Credibility is a qualitative score that will assist in the comparison of regions. This metric does not imply complete stability for geographic factors. For example, if a county has had significant improvements in managing health cost, then its cost may decrease by more than 5%. This report considers other metrics to measure geographic cost that would account for this variability.

Exhibit 10: Credibility

Member Months in Data required so metric is satisfied	Credibility Score	Credibility Metric
Greater than 420,000	High	County cost for each year remains within 0%-5% of average for all years
Between 100,000 and 420,000	Medium	County cost for each year remains within 0%-12% of average for all years
Between 44,000 and 100,000	Low-Medium	County cost for each year remains within 0%-18% of average for all years
Less than 44,000	Low	County cost can vary higher than 18% of average

Colorado Total Health Cost and Geographic Study

As an example, Greeley County has a credibility score of high and the most consistent total cost percents of 112%, 112% and 111% of the average (2010, 2011 and 2012 respectively). This implies that Greeley County may be credible enough to stand on its own.

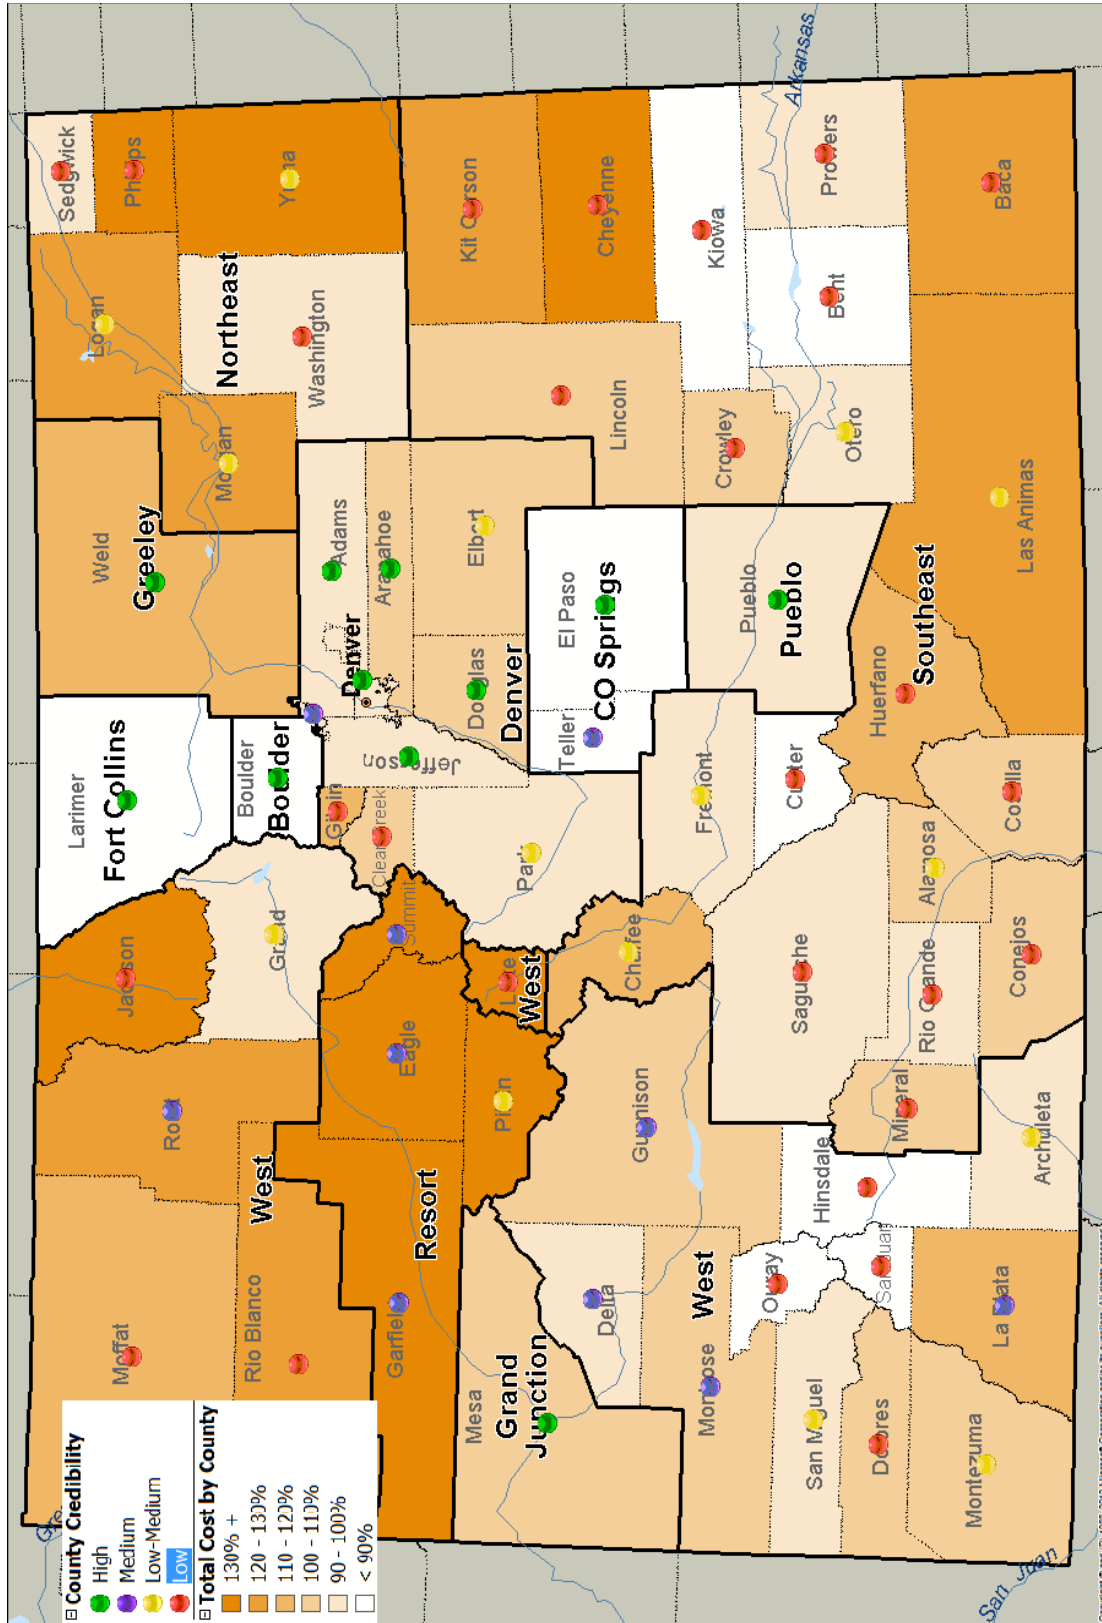

Contrast this with Mineral County which has a credibility score of low and total cost percent of 71%, 70% and 183%. These vast differences can occur without credible membership and are usually due to a few large claims. This county must be grouped with other counties to gain credibility.

See exhibit 11 on the next page for a map of total cost and credibility by county. See appendix 1 for more detail.

Colorado Total Health Cost and Geographic Study

Exhibit 11: Map - Total Cost by County with Credibility

Colorado Total Health Cost and Geographic Study

Geographic Study:

Prior to the Affordable Care Act, insurance carriers in Colorado (and many other states) were able to develop their own geographic rating areas (and rating factors) for individual, small group and large group markets. These regions are typically developed by analyzing: unit cost structures (depends on provider contracts); utilization patterns; and credible membership base in defined regions.

Under the ACA, a state has the option to default the rating areas to the Metropolitan Statistical Areas (MSA) plus one Non-MSA for all other areas (refer to this as MSA + 1). The state has the option to expand upon those areas as long as the regions:

- are actuarially justified;
- are not unfairly discriminatory;
- reflect significant differences in health care unit costs;
- lead to stability in rates over time;
- apply uniformly to all issuers in a market;
- and are based on the geographic boundaries of counties, three-digit zip codes, or metropolitan statistical areas and non-metropolitan statistical areas.

In theory, the only two major changes post ACA are:

- Regions apply uniformly to all carriers (before carrier had option to define based on their own experience and contracts).
- Must be actuarially justified if other than MSA + 1 is used.

In order to justify geographic regions, MN used three metrics as listed below.

Exhibit 12: Miller & Newberg Geographical Scoring Method

Metric	Primary Applicable Component of Law	Primary Applicable Component of Law
Credible Membership	All	All
Stability in Utilization patterns (migration patterns)	Lead to Stability in rates over time	All
Standard Deviation/Variability of Total Cost	Not Unfairly Discriminatory	All
Cost per Unit	Reflect significant differences in health care unit costs	All

Colorado Total Health Cost and Geographic Study

The DOI has asked MN to consider 5 possible regions, including the current, in the geographic study.

The regions considered are:

- 7 MSA + 4: current 2014 rating regions
- 7 MSA + 2: new west region combines current Resort + West
- 7 MSA + 1: combines all current Non-MSA regions into one (ACA default)
- RCCO regions: Regional Care Collaborative Organization Regions (see exhibit X)
- 6 MSA + 2: Remove Grand Junction as MSA and combine with west region

See Exhibit 13 for a map of regions.

(remainder of page intentionally left blank)

Colorado Total Health Cost and Geographic Study

Exhibit 13: Geographical Areas Considered:

Current Rating Areas (7 MSA plus 4 Non-MSA)

7 MSA plus 2 Non-MSA

7 MSA plus 1 Non-MSA

RCCO Regions

6 MSA plus 2 Non-MSA

Colorado Total Health Cost and Geographic Study

Credibility of Regions

Credibility is defined by member months in the study data (combines all carriers). Credibility for a particular carrier may be less. Credibility for future studies will be enhanced as CIVHC works to enhance the number of complete carriers and adds small group data to their experience.

The northeast region in the 7 MSA + 4 region has medium credibility. This is the only regional grouping in all geographic areas considered that is not high. Therefore, 7 MSA + 4 ranks as the second best regional grouping with all others having rank 1.

Exhibit 14: Credibility Scorecard

Region	Rank
All except 7 MSA + 4	1
7 MSA + 4	2

Utilization and Migration Patterns

Utilization and migration patterns drive stability in rates. For example, provider contracts in the northeast have the potential to be very different from provider contracts in the west due to the natural occurrence of different providers in the region. In addition, you'll see in the charts below that members in the northeast do not utilize services west and vice versa. Grouping these regions could lead to instability in current costs and/or future costs as contracts change in those regions.

Migration charts were developed. These charts illustrate the region where the member lives, the region where the member incurred services, and the percent of total cost in that region.

Approximately 19% of provider zip codes are invalid or out of state with the majority of those estimated to be invalid. These claim dollars are not illustrated in the charts. In addition, the accuracy of the carrier submitted provider physical address was not validated, however, the utilization patterns are reasonable enough to be considered as part of a the geographic score.

See exhibits 16 - 20 for migration patterns for the various groupings. Ranking migration patterns involves two main concepts:

- Do the members utilize services in their current region more than any other region (the diagonal in the chart)? If so, the migration pattern passes this test.
- When combining regions, do the regions, prior to combining, have similar utilization patterns in the other regions?

All regions satisfy the first bullet point. When considering the current regions, the non-MSA regions all have varied utilization patterns off the diagonal and any combination of non-MSA regions lessens the stability in utilization. Therefore, the non-RCCO regions rank the following way:

Colorado Total Health Cost and Geographic Study

Utilization / Migration Scorecard:

Exhibit 15: Utilization/Migration Scorecard

Region	Rank
7 MSA + 4	1
7 MSA + 2	2
7 MSA + 1	3
6 MSA + 2	3
RCCO	Not Scored / Fails Discriminatory Test

Colorado Total Health Cost and Geographic Study

Standard Deviation/Variability of Total Cost

Exhibit 21 below measures the variability within a region. For example, consider the Southeast region in the 7 MSA + 4 segment (table directly below). Within this region, the county with the highest cost (max factor = 1.36) is 36% higher in cost than the average for that region, likewise the county with the lowest cost (min factor = 0.78) is 22% lower than average for that region. The standard deviation column measures how much the individual counties vary from the county average, so a higher standard deviation typically corresponds to higher max and min. In addition, a county with low credibility should be weighted less. The credibility variability score columns adjust for this. Regions with lower standard deviation scores have less variability and therefore have less potential for discrimination.

Exhibit 21: Total Cost Variability Score

Colorado Total Health Cost and Geographic Study

Exhibit 22: Standard Deviation/Variability of Total Cost Scorecard

Region	Rank - Description
7 MSA + 4	1
7 MSA + 2	2 – Slight Increase in variability when combining regions
7 MSA + 1	2 - Minor differences in disparity scores from 7 MSA + 2
6 MSA + 2	Fails test. Slight increase in variability from 7 MSA + 1, however, Grand Junction is credible on its own with a very high migration rating. Grand Junction should stand on its own.
RCCO	Fail test - Disparity measures increase too much when compared to other regions

Unit Cost Analysis

Medical claims data were submitted by claim ID. Different claim IDs with the same member, beginning service date, provider ID and category (Inpatient, Outpatient or Professional) were rolled up into one unit, described here as an admit (inpatient) or a visit (outpatient and professional). Pharmacy claims were submitted by script count. A detail of unit costs by region and category are illustrated in Appendix 4. Units cost by category were then calculated as a percent of average. The unit cost amounts were then weighted by the percent dollars in that category (Exhibit 9). Overall unit cost percents are illustrated in exhibit 24 below.

The result (scorecard) is illustrated below.

Exhibit 23: Unit Cost Scorecard

Region	Rank - Description
7 MSA + 4	1
7 MSA + 2	2 – Unit cost varies reasonably between the 4 Non-MSA’s. More variation in units cost occurs with combining regions
7 MSA + 1	3 – Unit cost varies reasonably between the 4 Non-MSA’s. More variation in units cost occurs with combining regions
6 MSA + 2	Not considered, fails other tests
RCCO	Not considered, fails other tests

Colorado Total Health Cost and Geographic Study

Appendix 2

Completion: Inpatient, Outpatient, Professional, & Pharmacy:

Medical claims from the commercial major medical + pharmacy base were completed for this study. The standard actuarial completion factor method was used, with separate factors developed for inpatient, outpatient, and professional claims. Pharmacy claims were assumed to have enough hindsight to be complete.

Table: Non-Completed vs. Completed Total Cost in millions

Service Year	2010	2011	2012	2013*
Inpatient Claims	\$362	\$336	\$314	\$55
Inpatient Completed	362	337	327	120
Outpatient Claims	467	450	414	94
Outpatient Completed	467	451	420	139
Professional Claims	598	570	574	117
Professional Completed	598	570	581	155
Pharmacy Claims	291	275	288	75
Total Claims	\$1,717	\$1,632	\$1,591	\$341
Total Completed	\$1,717	\$1,633	\$1,616	\$489

* Incomplete year, claims data only available through March 2013.

The study period was limited to claims incurred before 2013, in part due to the large effect completion had on the most recent months of claims data.

Colorado Total Health Cost and Geographic Study

Appendix 6: Claim Categorization and Units Methodology:

High Level: Inpatient, Outpatient, Professional, & Pharmacy:

For the study medical claims were bucketed at a high level into inpatient, outpatient or professional. Claims were first split between those that included a revenue code and those that did not. Claims lacking a revenue code were bucketed as professional. Claims with a revenue code for a room and board charge (revenue codes: 100 – 219) or with a MS-DRG code or with a place of service as Inpatient Hospital (21) , Skilled Nursing Facility(31), Nursing Facility(32), Custodial Care Facility(33), Hospice(34), Inpatient Psychiatric Facility(51), Psychiatric Residential Treatment Center(56), or Comprehensive Inpatient Rehabilitation Facility(61) were marked as inpatient, with the remaining marked as outpatient.

The results of this high level bucketing were compared to the Claim_Type_Cd provided by the Center for Improving Value in Health Care (CIVHC). It was found for 99.91% of the claims the Miller & Newberg, high level bucketing agreed with CIVHC’s Claim_Type_Cd, due to this high correlation the Claim_Type_Cd was deemed reasonable to be used in this study.

For pharmacy, all claims from CIVHC’s pharmacy tables were categorized as Pharmacy.

Benefit Detail Bucketing:

Inpatient, outpatient, professional, and pharmacy claims were broken down into 26 benefit detail categories.

Inpatient claims were split into 4 categories using the MS-DRG descriptions from CMS version 27 table. A hierarchy was used to force a claim into only a single category in the cases where a claim had multiple MS-DRG codes.

Hierarchy	Category
1	Delivery/Newborn
2	Inpatient Surgery
3	Mental Health Inpatient
4	Inpatient Medical

Outpatient claims were split into 10 categories, using a mixture of revenue codes, procedure code, (Current Procedural Terminology (CPT) codes) and Health Care Financing Administration Common Procedure Coding System (HCPCS)), and Berenson-Eggers Type of Service (BETOS). A hierarchy was used to identify claims into a single category in the cases when a claim had multiple categories.

Hierarchy	Category	Coding Used
1	Emergency Room	Revenue/ Procedure
2	Outpatient Surgery	Revenue/ Procedure
3	Observation	Revenue/ Procedure
4	Advanced Imaging	BETOS

Colorado Total Health Cost and Geographic Study

5	Imaging	BETOS
6	Lab/Pathology	Revenue/ Procedure
7	Therapy (PT/OT/ST)	Revenue/ Procedure
8	DME/Prosthetics/Supplies (OP)	BETOS
9	Mental Health Outpatient	Revenue/ Procedure
10	Other Outpatient	All Others

Professional claims were split into 9 categories, using a mixture of procedure codes, place of service codes, and BETOS. A hierarchy was used to identify a claim into a single category in cases where a claim satisfied multiple categories.

Hierarchy	Category	Coding Used
1	Ambulance - Air	Procedure
2	Ambulance - Land	Procedure
3	Mental Health Professional	Procedure OR Place of Service
4	DME/Prosthetics/Supplies (P)	BETOS
5	Facility Surgical Visit	Procedure AND Place of Service
6	Office Surgical Visit	Procedure AND Place of Service
7	Facility Visit	Place of Service
8	Office Visit	Place of Service
9	Other Professional	All Others

Pharmacy claims were split into 3 categories, specialty, brand, or generic. The 2012 Optum specialty drug list was used to define specialty category along with marking any National Drug Codes (NDC) where the cost per 30 days was greater than \$1,000. Non-specialty drugs were then further identified between brand and generic using the Generic_Ind field provided by CIVHC.

Units Methodology:

For units, medical claims were combined such that all claims assigned to the same member composite ID, and admitted on the same date to the same service provider with the same high level categorization were counted as a single unit. Units for pharmacy claims were counted such that each script filled was counted as a single unit.
