Hal D. Simpson  
State Engineer

Greg Walcher  
Director

George D. VanSlyke  
Project Manager

# WATER LEVELS IN SELECTED BEDROCK AND ALLUVIAL AQUIFERS OF WESTERN COLORADO

2001

This report presents water level data from 57 wells located in Archuleta, Delta, Garfield, Jackson, La Plata, Mesa, Moffat, Montrose, and Rio Blanco Counties. Most of the wells for which data are reported were originally constructed in the 1970's by the United States Geological Survey as a part of their statewide monitoring well network. The U.S.G.S. routinely measured water levels in these wells until 1982. That historical data is included in this report, along with more recent data gathered by the Colorado Division of Water Resources.

The wells listed in this report are now part of a state-wide water level monitoring network funded by Senate Bill 200 (1987 Legislative Session). That legislation directed that a portion of the fees collected for applications for water well permits be used for the establishment of a program to monitor ground water levels throughout the state.

In 1991, the Division of Water Resources initiated a program to monitor water levels in about 50 of the wells that had been a part of the U.S.G.S. monitoring system. A small number of additional wells measured are used for irrigation, stock watering, or domestic purposes. Several of the Rio Blanco County wells are also measured at least quarterly in connection with the ongoing monitoring in and around the C-b oil shale tract, and the solution mining operation of North American Chemical Company's White River nahcolite (sodium bicarbonate) plant. These data are also presented where available. No wells were measured by DWR in 1994.

In this report, the wells are grouped first by county in alphabetical order and then by township, range, and section within each county. Only 1 well is measured in each of the following counties; Archuleta, La Plata, Mesa, and Moffat. Rio Blanco County contains the largest number of wells (34) being monitored. The well I.D., shown on each tabular data page, and along the left margin of each hydrograph describes the well location in the standard well numbering system used by the Bureau of Reclamation and the United States Geological Survey. The aquifers monitored include the alluvium, the Fruitland, Mesa Verde, Wasatch, North Park, San Jose, Dakota/Burro Canyon, Green River, Uinta and Parachute Creek members or formations. The specific aquifer being monitored in a well is shown on the data sheet for that well.

In addition to the tabular data, the water level change for each well is presented on a hydrograph. When interpreting the hydrographs, you should note carefully the month and year of the measurement, as there is a 9 or 10 year data gap between the historic U.S.G.S. data and the DWR data. Generally, this gap occurs during the years between 1979 and 1991. The dashed segment on each hydrograph identifies the period during which no data were gathered. In addition, some data points that were obviously incorrect have been deleted before preparation of the hydrographs. The hydrograph for each well is presented on the page opposite the tabular data. Hydrographs were not created for wells with only 2 or 3 data points.

Personnel of the United State Geological Survey gathered water level data prior to 1983. Divisions of Water Resource personnel, Steve Joliat and Glenn Graham have gathered data since 1990. North American Chemical Company personnel gathered some of the data for well Nos. SC00109814ADC1 and SC00109814ADC2 located in Rio Blanco County. The information contained in this report was compiled and prepared for publication by Glenn Graham.
