49th Annual Beef Cattle Improvement Report and Sale Data

**Colorado State University and
Four Corners BCIA Bull Sale
Saturday, April 4, 1998**

D.W. Schafer, R.D. Green

SATELLITE PREVIEW
-----**THURSDAY, APRIL 2, 1998**-----

8:00- 9:00 p.m. Satellite preview of sale bulls & heifers - coordinates: G3, channel 18.

PRE-SALE SOCIAL
-----**FRIDAY, APRIL 3, 1998**-----

6:00-8:00 p.m. Cattleman's Pre-Sale Social. K-Bob's Restaurant, Durango.

AUCTION
-----**SATURDAY, APRIL 4, 1998**-----

San Juan Basin Research Center, Hesperus, CO, 16 miles southwest of Durango on Colorado State Highway 140 (40 miles north of Farmington).

- 9:00 a.m. Display of sale bulls & heifers.
- 11:30 a.m. Lunch served by the Marvel Grange and sponsored in part by American Breeders Service. Satellite preview of sale bulls & heifers - coordinates: G3, channel 18.
- 12:30 p.m. Auctioneer - Madden Brothers, Torrington, WY
Auction of approximately 170 performance tested bulls & heifers from the herd of the Colorado State University-San Juan Basin Research Center and Four Corners Beef Cattle Improvement Association (BCIA) breeders.

-----**GENERAL INFORMATION**-----

Satellite Transmission. The 49th Annual Four Corners Bull & Heifer Sale will be broadcast via Superior Productions satellite (coordinates: G3, channel 18). Buyers may choose to attend the sale or sit in the comfort of their own home and buy bulls simply by phoning one of the sale day phone numbers available to pre-registered buyers. The bulls and heifers will be taped on video prior to the sale and their pictures will be broadcast simultaneously as they sell with the sound being provided live from the sale site via telephone link. A preview of the bulls and heifers may be seen April 2 at 8:00 p.m. MST and again on April 4 at 11:30 a.m. MST followed by the sale at 12:30 p.m. MST. Persons interested in purchasing bulls and/or heifers via satellite need to call Dave Schafer at (888) 598-9775 to register for a buyer number. You must have a buyer number to purchase bulls and/or heifers over the satellite. If you do not have a satellite, try contacting a neighbor or your local Extension agent to see if they will let you view the sale.

Terms of Sale. All lots will be sold to the highest bidder. The Auctioneer will settle any disputes as to bids by declaring all bids off and reselling the animals in question. Animals sold in this sale will be fed and cared for free of charge for twenty-four hours following the sale, but at the owner's risk, and will be turned over to the purchaser or loaded for shipment as he may direct. A certificate of transfer and bill of sale will be furnished for each animal sold, and a registration certificate will be furnished on all registered animals by the Consignor. The Purchaser must present a bill of sale at the loading pens prior to removing the animal(s) from the premises. The terms of sale are cash and all settlements must be made at the close of the auction unless other arrangements have been made prior to the sale.

Delivery & Insurance. Free delivery will be provided to central locations within a 500 mile radius and/or to persons with purchases of \$10,000 or more. For purchases outside the 500 mile radius and under \$10,000, low cost delivery will be arranged at the time of settlement. Bulls &/or heifers selling to Canada or Mexico will be delivered to the nearest port of entry at the border. Expenses and transportation beyond the border will be the responsibility of the buyer. All bulls & heifers are cleared for interstate shipment and have been tested in accordance with rules and regulations approved by the Animal Health Division (USDA) and the State of Colorado as a certified brucellosis and accredited tuberculosis free herd. Buyers requesting to have their bulls &/or heifers delivered must purchase low cost insurance(1.5% of the purchase price for 15 days coverage) at the time of settlement to protect the hauler. The same insurance is also available to all other buyers upon request and for longer coverage periods if so desired.

Breeders Guarantee. All sale bulls are guaranteed to be breeders. All bulls are subjected to a breeding soundness exam (BSE). All bulls must meet the minimum standards set by the Four Corners BCIA. Only bulls that meet this criteria are offered for sale. If for some unforeseen reason a bull should prove to be a non-breeder, it should be brought to the attention of the test personnel and/or seller within 90 days after the sale. If an adjustment is to be made, the Four Corners BCIA Cooperator must be provided with a certificate from a veterinarian stating the problem with the bull.

Structural Soundness Exam. All sale bulls will be subjected to a comprehensive structural soundness exam. The bulls have been managed and developed in such a way as to minimize feet and leg problems and to insure their future soundness. However, despite our best efforts, some bulls leave something to be desired when it comes to feet, legs and structural soundness. Therefore, instead of trimming feet or utilizing other methods to cover up unsoundness, the bulls will be critically analyzed by two qualified cattlemen and a veterinarian for structural soundness. Structurally unsound bulls will be removed from the sale.

Health Program. All bulls & heifers were tested for tuberculosis and brucellosis upon arrival at the test center. All bulls & heifers were treated with Ivermectin-F for internal and external parasites. All bulls have been inoculated with IBR, BVD, BRSV, PI₃, 7-Way Clostridia, and H. Somnus vaccine. All heifers have been vaccinated for brucellosis and tested for pulmonary arterial pressure (PAP), reproductive tract score (RTS) and pelvic measurements. All bulls have been tested for breeding soundness, pelvic measurements and PAP. Measurements from these tests are provided in the catalog.

Obligation. It shall be expressly understood that the sponsors of this sale, Colorado State University-San Juan Basin Research Center and Four Corners BCIA, act only as agents for the consignors and assume no liability, legal or otherwise. All guarantees shall constitute a contract between the Consignor and the Purchaser of each lot.

Sealed Bids. Sealed bids for any of the bulls or heifers may be handled through Dave Schafer, San Juan Basin Research Center (970-385-4574).

-----PERFORMANCE TESTING SINCE 1949-----

Ranchers from the Four Corners area and surrounding western states have been testing bulls cooperatively with Colorado State University's San Juan Basin Research Center since 1950. Colorado State University began performance testing in 1949 and opened the test to area ranchers in 1950. In 1975, a forty pen bull testing facility was built by the Cooperators to test over 200 bulls annually.

The Four Corners Bull Test offers purebred and commercial cattlemen the opportunity to purchase bulls with good genetics that will perform on mountain ranches. Bulls purchased from this test have greatly influenced the genetics of herds in Colorado and neighboring states. Ranchers who have purchased Four Corners performance-tested bulls for more than 10 years have reported 100-200 pound increases in weaning and yearling weights.

The elevation of the Four Corners Bull Test is 7,600 feet making it the nation's only high mountain bull test. Many of the cooperators as well as buyers run their cattle at high elevations and are concerned about costly losses to brisket disease (high altitude disease). Research at Colorado State University has shown that pulmonary arterial pressure (PAP) is a very good indicator of brisket disease susceptibility. Additionally, research has shown that differences in PAP values are highly heritable; therefore, selection for lower PAP values can lower the incidence of brisket disease. PAP information is provided in the catalog.

-----PERFORMANCE TESTING PROCEDURES-----

The bulls were delivered to the test facility on October 20, 1997. Following a 21 day adjustment period, the bulls were weighed on the 112 day test November 10, 1997. Bulls were weighed at 28, 56, 84, and 112 days with 2-day weights taken for the initial and 112-day periods. Bulls were penned in groups of 3 to 6 bulls per pen.

Bulls were fed twice daily, a mixture of sorghum silage (45%), corn (35%), ground alfalfa/grass hay (17%), soybean meal (3%), and a vitamin/mineral supplement. The feed was weighed to each pen. Feed conversion was calculated for the group of bulls in each pen. Feed efficiency values were adjusted to a common body weight as recommended by the Beef Improvement Federation.

-----ACKNOWLEDGMENTS-----

A HUGE THANK YOU to Stetson Conrad for feeding & caring for the bulls & to the San Juan Basin Research Center Crew (*Dave Schafer, Gary Conrad, Tom Champion, Ronda Shockley, Dan Selzer, Josh Golden, Kristin Goff & Rena Bacus*) for their hard work in getting things ready for the sale. Your efforts are greatly appreciated!

ALSO, SPECIAL THANKS to Beth LaShell, the La Plata County 4-H Livestock Judging Team & their parents for clipping & washing the bulls. Your hard work is VERY much appreciated.

GLOSSARY OF TERMS & ABBREVIATIONS

112 Day Weight (112 DAY WT) - Weight taken at the end of the 112 day test. This weight is used as the bulls actual yearling weight and for calculating adjusted yearling weight.

Accuracy (ACC) - Correlation between an animal's unknown actual breeding value and a calculated estimated breeding value.

Actual Weaning Weight (ACT WW) - Weight taken at the time the calf is removed from the cow and weaned.

Adjusted Hip Height (ADJ HIP HT) - Height of the animal at the hips adjusted to 365 days of age using the following formula (Note: The value 0.025 is used in the same formulas to adjust heifers hip heights).

$$\begin{aligned} \text{Under 365 days in age:} & \text{ Actual Hip Ht.} + (\text{Number of days under 365} \times 0.033) \\ \text{Over 365 days in age:} & \text{ Actual Hip Ht.} - (\text{Number of days over 365} \times 0.025) \end{aligned}$$

Adjusted Pelvic Area (ADJ PELV AREA) - Obtained by multiplying the height and width measurements of the pelvic opening and adjusting to a common age of 365 days. Area is measured in square centimeters (cm²). Pelvic area has been shown to influence calving difficulty in first-calf heifers. The following formulas are used to adjust pelvic openings for males and females:

$$\text{Males: Actual Pelvic Area} + .25(365 - \text{actual age}) \quad \text{Females: Actual Pelvic Area} + .27(365 - \text{actual age})$$

Adjusted Weaning Weight (ADJ WW) - An un-shrunk, off-the-cow weight adjusted to 205 days of age and to a mature dam age equivalence.

$$\frac{(\text{Actual Weaning Wt.} - \text{Birth Weight})}{\text{Age at weaning}} \times 205 + \text{Birth Wt.} + \text{Age of Dam Adjustment}$$

Adjusted Yearling Weight (ADJ YW) - An un-shrunk weight adjusted to 365 days of age and for age of dam. The following formula is used:

$$\frac{(\text{Actual Yearling Wt.} - \text{Actual Weaning Wt.})}{\text{Number of days between the two weights}} \times 160 + \text{Adjusted Weaning Weight}$$

Average Daily Gain (ADG) - Measurement of daily body weight change in an animal on a feed test.

Beef Improvement Federation (BIF) - A federation of organizations, businesses, and individuals interested or involved in performance evaluation of beef cattle. The purposes of BIF are to bring about uniformity of procedures, development of programs, cooperation among interested entities, education of its members and the ultimate consumers of performance evaluation methods, and to build confidence of the beef industry in the principles and potentials of performance testing.

Birth Weight (BW) - The weight of a calf taken within 24 hours after birth. Heavy birth weights tend to be correlated with calving problems, but the conformation of the calf and the cow are contributing factors.

Breeding Soundness Exam (BSE) - Includes an internal and external physical evaluation and an evaluation of a bull's semen for quality and quantity. A bull must meet certain criteria to be declared a satisfactory breeder.

Expected Progeny Difference (EPD) - The difference in performance to be expected from future progeny of a parent, compared with that expected from future progeny of all other parents evaluated in the analysis when bred to equal mates. EPD is an estimate based on progeny testing and is equal to one-half the estimate of breeding value obtainable from the progeny test records. EPDs for growth traits are generally expressed in pounds, either as a plus difference or minus difference from the population average. EPDs are generally reported in the units of measure of the trait, (e.g., pounds, cm, cm², percent, etc.).

Feed Conversion (FEED CONV) - Also referred to as feed efficiency, this is a measure of units of feed consumed per unit of weight gained. Also the production (meat, milk) per unit of feed consumed.

Frame Score (FR SC) - A score based on the actual measurement of hip height that was calculated according to BIF guidelines using the following formula:

$$\text{Frame Score} = -11.548 + .4878 * (\text{hip ht}) - .0289 * (\text{days of age}) + .00001947 * (\text{days of age})^2 + .0000334 * (\text{hip ht}) * (\text{days of age}).$$

Initial Weight (INIT WT) - Weight of the animal at the beginning of the performance test.

Maternal Value of Daughters-Milk (MK) - This value relates to those traits that are maternally influenced and expressed only by the female, e.g., milk production. It is the difference in performance expected from future progeny of daughters of the parent in question as compared to other parents evaluated in the analysis. Both the sire and dam transmit genes for maternal traits to their female progeny. These daughters express their full breeding value (2 x their EPD) for the maternal trait.

Maternal Value of Daughters-Wean WT (TM) - This value is calculated for traits that are both directly and maternally determined, such as weaning weight. It is the difference in total performance expected from the future progeny from daughters of the parent in question due to that parent's genetic contribution to its daughters. It is calculated as one-half the direct EPD value plus the maternal EPD value. The EPD value of the parent predicts the performance of its grand-progeny.

Most Probable Producing Ability (MPPA) - An estimate of cows's future productivity for a trait (such as progeny weaning weight ratio) based on her past productivity. For example, a cow's MPPA for weaning ratio is calculated from the cow's average progeny weaning ratio, the number of her progeny with weaning records, and the repeatability of weaning weight.

Number of Contemporaries (NO CONT) - The number of animals of similar breed, sex, and age, against which an animal was compared in performance tests. The greater the number of contemporaries, the greater the accuracy of comparisons.

Percent Inbreeding (PCT INB) - Percent of loci that have genes identical by descent (homozygous).

Pulmonary Arterial Pressure (PAP) - Obtained by a procedure called "right heart catheterization", this test is the best indicator to date for identifying animals predisposed to Brisket Disease. The test is not 100 percent and should be used as such. Generally, cattle with PAP values greater than 50 are considered high and cattlemen should be cautious of using them at high elevations.

Reproductive Tract Score (RTS) - Score used to estimate sexual maturity (puberty) in heifers via rectal palpation of the uterine horns and ovaries. The score ranges from 1 to 5. A RTS of 1 = an infantile tract & not cycling; 2 = an infantile tract with small follicles & not cycling; 3 = on the verge of cycling, slight uterine tone, follicles present; 4 = cycling heifers, good uterine tone & size, and follicular growth; 5 = cycling heifers with palpable corpus luteum.

Scrotal Circumference (SC) - A measure of testes size obtained by measuring the distance around the testicles in the scrotum with a circular tape. Related to semen producing capacity and age at puberty of female sibs and progeny.

Total Maternal (TM) - see Maternal Value of Daughters-WEAN WT.

Weight per day of age (WDA) - Weight of an individual divided by the individual's age in days.

Weight Ratio (IRAT) - In beef cattle evaluations, weight ratios refer to the weight of an individual animal relative to the average of all animals in the same group. An average ratio is 100 so if an animal has a ratio of 105 he is 5% above the average and if an animal has a ratio of 95 he is 5% below the average. Ratios are calculated using the following formula:

$$\frac{\text{Individual record}}{\text{Average of animals in group}} \times 100.$$

AUCTION - SATURDAY, APRIL 4, 1998

12:30 p.m.

Performance of Cooperator and Experiment Station Purebred and Composite Bulls

Performance Information: The information in the following section was generated from the bulls on the 112 day performance test. Weaning weight was adjusted to 205 days of age and for age of dam according to each breed organization's standard adjustments. Adjusted weaning weights and ratios were generally supplied by the cooperators. Adjusted yearling weight was computed as adjusted weaning weight plus average daily gain from weaning to the 112 day test weight multiplied by 160. Average daily gain ratios were computed using the bull's record divided by the average of the bulls of the same breed group, multiplied by 100. Breed average daily gains are presented below. Because of pre-test differences between ranches, critical comparisons should be made using the information generated since the bulls began the 112 day test. All bulls listed in the catalog will sell provided no problems arise between the printing of this catalog and sale day.

Sale Order: The bulls are list by sale order within breed. This year each breed will be rotated through the sale order and only a few will sell at a time instead of all of one breed as in years past. For example, there are 42 Herefords, 21 Red Angus and 16 Angus. We will sell the first 25% of each breed in rotation. So, 11 Herefords will sell, then 5 Red Angus, followed by 4 Angus and the remaining breeds. Then we will repeat the process and sell the second 25% of each breed and continue until all bulls have passed through the sale ring. A sheet listing the final sale order will be provided on sale day. The sale order of breeds will be: Hereford, Red Angus, Angus, Gelbvieh, Simmental, Charolais, Limousin, System 1 Composites and Gelbvieh-Hereford Crosses.

Calving Ease Bulls (CE): Calving ease bulls are marked with a "CE" in the upper right hand corner of the bull's information box. Calving ease bulls were selected using actual birth and birth weight EPD.

Pulmonary Arterial Pressure (PAP): Obtained by a procedure called "right heart catheterization", this test is the best indicator to date for identifying animals predisposed to Brisket Disease (High Altitude Disease). The test is not 100 percent accurate and should be used as such. Generally, cattle with PAP values greater than 50 are considered high and cattlemen should be cautious of using them at elevations above 7000 feet. Cattlemen with ranches at less than 5000 feet elevation do not need to be concerned with the PAP value unless they are selling breeding stock to cattlemen at high elevations. Bulls with PAP values greater than 50 are best suited for operations at less than 5000 feet elevation.

Expected Progeny Differences (EPDs): The EPDs presented in the following section were obtained from their respective breed associations. EPDs are the expected differences (expressed in pounds) in performance of a sire's progeny when compared to fixed base. While EPDs for birth, weaning and yearling weights refer to the progeny of sires, the maternal values of milk and weaning weight refer to how we expect progeny of daughters to perform. The accuracy value is a measure of reliability for the corresponding EPD. They range from 0 to 1 and are calculated according to Beef Improvement Federation Guidelines. The higher the value, the more confidence we have that the sire's EPD will not change much with additional progeny. In general, the more information on a sire, the higher the accuracy value. Because these bulls are young, the EPDs presented are pedigree estimates (or back solutions) and would have very low accuracies. Additionally, EPDs cannot be compared across breeds. Each breed association is responsible for producing its' own sire summary and therefore, different methods and data sets are used. The following EPD estimates are the best available for young bulls.

BREED AVERAGE DAILY GAINS

Breed	Number	ADG
Hereford	63	2.79
Angus	20	2.89
Red Angus	26	2.83
Simmental	8	3.00

That's not all, turn the page and select some open yearling heifers to go with your new bull.

System 1 Composite =

1/4 MARC III, 1/4 RX3, 1/4 CASH, 1/4 Hereford

MARC III = 1/4 Red Poll, 1/4 Pinzgauer, 1/4 Angus, 1/4 Here.

RX3 = 1/2 Red Angus, 1/4 Red Holstein, 1/4 Hereford

CASH = 1/4 Charolais, 1/4 Brown Swiss, 1/4 Angus, 1/4 Here.

FOUR CORNERS HEIFER DEVELOPMENT PROGRAM

The Four Corners Heifer Development Program was initiated this year in an effort to offer breeders a place to develop and market their replacement heifers. There is no requirement for the participating breeders to sell their heifers. They may simply choose to have their heifers developed and then take them home. The program was designed to develop heifers not to test them. Therefore, you will not find any gain information for any of the heifers listed in the catalog. The heifers were not fed for maximum gain. The heifers were fed a ration consisting of Gro-Gest B68 Pellets, corn, alfalfa/grass hay and sorghum silage. The heifers were fed to gain 2 lbs/day. These heifers will be ready to take home and breed at the time of sale. Pulmonary Arterial Pressures (PAP), reproductive tract scores (RTS), and pelvic areas are provided on each of the heifers.

The heifers will be offered for sale immediately after all the bulls pass through the sale ring. The heifers will be sold by breed in the order they are listed and in groups according to the owners specifications. This means an owner may sell his/her heifers as a group or offer the buyer choice of one or more. All heifers are being sold as open and ready to breed. All heifers listed will sell provided no problems arise between the printing of the sale catalog and sale day.

SEMEN AUCTION

American Breeders Service (ABS) has donated 10 straws of semen to be auctioned at the beginning of the sale April 4th. The buyer will have their choice of any of the eight bulls listed below. ABS will deliver the semen to your tank whenever you request. Proceeds from the sale of this semen will go towards the Four Corners BCIA to help offset costs associated with the complimentary lunch on April 4th.

**A METHOD TO INCREASE THE NUMBER OF CYCLIC YEARLING HEIFERS
AT THE BEGINNING OF THE BREEDING SEASON**

D.G. LeFever, D.W. Schafer, G.L. Mathews, J.C. Whittier, and T.W. Geary

*Department of Animal Sciences
Colorado State University*

Summary

This paper summarizes three trials that involved feeding melengestrol acetate (MGA) to yearling heifers prior to an estrous synchronization period followed by a five day artificial breeding period. The objective was to increase the number of heifers that had cycled, or were nearing their first estrous cycle by the start of an estrous synchronization program that was 32 days before breeding. By having more heifers cycling before breeding, there would be a greater likelihood that more heifers would respond to synchronization and become pregnant earlier in the breeding period for the treated heifers. In all three trials, treated heifers received .5 mg MGA/head daily for 7 or 9 days. Synchronizing of estrus was done using the MGA-prostaglandin system.

TABLE 1. TRIAL SUMMARIES FOR MGA PRE-TREATMENTS

* Significant difference (P<.20) ** (P<.001) *** (P<.0001)

¹ Two 7-day periods 13 days apart

² Determined by Reproductive Tract Score (RTS)

In all three trials there were significantly more heifers cycling or near cycling 32 days before breeding in the treated group. Pregnancy rates for the 5 day synchronized breeding period varied between the three trials. Trial 1 had a 13% higher pregnancy rate for the non-treated group. This lower pregnancy rate for the treated group may have been due to the extended two MGA feeding periods plus synchronization of estrus with MGA. Trial 2 and 3 had a 4 and 15% increase in pregnancy rate for the treated groups. It would appear from these results feeding MGA for 7-9 days, at approximately 60-80 days before a synchronized breeding would also increase the number of pregnant heifers.

Introduction

There are many factors affecting puberty in yearling heifers. Some of these are 1) breed, 2) weight, 3) age, 4) body condition, 5) frame score and 6) different combinations of these factors. It has been shown by Wiltbank (1994) that yearling heifers that become pregnant in a short period of time (1-25 days) improves the likelihood that they will stay in the cow herd and produce a calf every year for a period of 8-10 years. Breeding heifers 1 to 3 weeks earlier than the cow herd plus synchronizing estrus helps to accomplish this. Estrus synchronization programs using progesterone have been shown to induce cycling in immature heifers and non-cycling cows (Odde, 1990). The use of progesterone plus estrogen has been used in very young heifers, 7 to 12 months of age to enhance cycling (Gonzalez Padilla et. al., 1975).

The costs of feeding replacement heifers to reach target weights and attain puberty 2-3 weeks before the cows breeding season is expensive and very difficult due to changing environmental factors. Some ranchers have to haul their heifers to lower altitudes with warmer environments and cheaper feed costs to accomplish this task. For this reason, an inexpensive pretreatment might be available to help more heifers to be near cycling before being synchronized into estrus.

Materials and Methods

Three different trials were used to measure the effect of pre-feeding melengesterol acetate (MGA) for different lengths of time and different periods before breeding on stage of puberty and pregnancy rate for a 5 day synchronized breeding period (Figure 1). Pretreated heifers were fed .5 mg of MGA in a one pound pellet. Non-treated heifers received the same pellet without MGA plus their normal ration of hay and silage. The method used to synchronize estrus in each trial involved feeding .5 mg of MGA / hd daily for 14 days followed by an injection of 25 mg PGF_{2α} (Lutalyse) 17 days after the last day of MGA feeding. Heifers were observed for estrus for 5 days at 12 hour intervals (a.m. and p.m.) starting one day after the PGF_{2α} injection. Heifers observed in heat were bred by one of three AI technicians 12 hours later. An equal number of pre-treated and control heifers were inseminated to each sire and by each technician.

Figure 1. Experimental Design for Pre-treated Groups in Trials 1, 2 and 3.

Trial 1 and 3 used mixed breed yearling heifers from the San Juan Basin Research Center, Hesperus, CO in 1996 and 1997. Trial 2 used Angus yearling-heifers from the John E. Rouse Research Center, Saratoga, WY in 1997. The heifer's description for each trial is shown in Table 2. Starting one day (day 32) before all the heifers in each trial began their synchronization of estrous, a pre-breeding examination was done. This examination included body weight, pelvic area, body condition score and reproductive tract score (Table 3). Body condition score (BCS) was determined by general observation and feeling the ribs and pin area. The scoring system ranges from 1-4 thin, 5-6 average and 7-9 fat.

TABLE 2. YEARLING HEIFER PRETREATMENT SYSTEMS USING MELENGESTROL ACETATE (MGA)

Trial No.	Total No. of Heifers	No. of Heifers Pre-treated	Days fed MGA	Start Treatment to Breeding (days)	Average Heifer Age at Start (months)	Average Heifer Age at Breeding (months)
1	101	50	2 times for 7 days each	83	11.5	14.3
2	166	82	7	85	10.9	13.7
3	99	50	9	56	13.4	15.2

The reproductive tract scoring (RTS) is described by Andersen et al. (1987). The score is determined by feeling the uterine horns and ovarian structures by rectal palpation. Score 1, 1.5 and 2 represent immature heifers, 2.5 and

3 advanced but not cycling, 3.5 near cycling, 4 cycling but no corpus luteum and 5 cycling with a corpus luteum. The score of 3.5 is determined mainly by the extra tone or coiling of the uterine horns and no structures on the ovaries. The use of ultrasound would not be able to detect uterine tone (score 3.5). The RTS for all heifers in each trial was determined by a skilled technician. The technician did not know if the heifers were pre-treated at the time of examination on day 32 before breeding.

TABLE 3. PERFORMANCE TRAITS FOR ALL HEIFERS 32 DAYS BEFORE BREEDING

Trial No.	Breed of Heifer	Average Weight (lbs)	Average Pelvic Area (cm ²)	Average Body Condition Score ^a	Average Reproductive Tract Score ^b
1	Angus-Hereford-Composite	695	162	5.66	4.30
2	Angus	671	157	5.10	3.31
3	Angus-Hereford-Composite	561	136	4.80	3.32

^a Score 1-4 Thin, 5-6 Average and 7-9 Fat

^b Score 1, 1.5-2 immature, 2.5-3 not cycling, 3.5 near cycling and 4-5 cycling.

In trial 1, blood samples were obtained from all heifers for progesterone content on days 9 and 1 before pretreatment and days 42 and 32 before breeding. [There were five heifers that were not detected to be cycling by the RTS on day 32 and classified as 3.5 (near cycling) as compared to the blood test for (> 1 mcg P₄/ ml) which indicated cycling. Four of these five heifers were detected cycling from blood taken on day 42 and not on 32 when the RTS was taken]. In trial 2, all heifers were bred with semen that had been pre-sorted for presence of Y bearing chromosomes (Seidel, 1998), use of sex sorted semen may have lowered pregnancy rate at the synchronized period. In trial 3, RTS was taken for all heifers before pretreatment and on day 33 to determine changes in RTS due to the pretreatment with MGA for treated versus non-treated heifers. In all three trials heifers were allotted equally to pretreatment versus non-treatment by cycling, age breed, body weight and body condition score.

After the five day synchronized AI period, all heifers were moved to individual breeding pastures and bred by single sires for 64 days. Heat detection (a.m. and p.m.) were observed for 10 days following AI to determine heifers bred by bulls for this period. The heifers in each trial were examined for pregnancy by rectal palpation 64 and 106 days after the start of the breeding season by one qualified technician. The length of pregnancy was determined by estimating the size of the fetus. The number of heifers near cycling or cycling on day 32 before breeding and pregnancy rate for treated versus non-treated heifers was statistically compared by Chi-Square analysis.

Results and Decision

In all three trials there were significantly more heifers near cycling or cycling 32 days before breeding in the pre-treated groups as compared to non-treated (Table 4). Pregnancy rates for the five day synchronized breeding was influenced by the RTS that was recorded 32 days earlier (Table 5). Heifers with RTS of 1.5 and 2 are normally culled and not incorporated into a synchronization of estrus regimen. Pregnancy rates at the synchronized period for heifers with a RTS of 3.5 were only three percent lower as compared to cycling heifers (score 4 and 5). They responded to the MGA-PGF_{2α} synchronization system with a 14% increase in conception as compared to heifers with a score of 3. It is not recommended to sell heifers with a RTS of 3 or 3.5 as the MGA synchronization program helps to stimulate these heifers into estrus.

Pregnancy rates for the five day synchronization breeding period varied between the three trials (Table 6). The pregnancy rates for treated heifers vs non-treated were as follows. Trial 1 (52% vs 65%), trial 2 (41% vs 37%) and trial 3 (54% vs 39%). In trial 1 the treated group was 13% lower in pregnancy rate as compared to the non-treated group. Previous work using extended feeding of MGA has resulted in 14% lower first service conception rate for MGA-treated heifers as compared to controls (Zimbelman et al., 1970). This difference might be due to follicular dynamics (Lucy et al., 1992). Large cystic and atretic follicles at the time of ovulation secreted more estrogen which may cause release of prostaglandin from the uterus and in turn regress the corpus luteum (Savio et al., 1990). A combination of poorer ova from mature follicles plus reduced sperm transportation and lower cleavage rates are reported in females

exposed to progesterone. This might explain that there were no differences in pregnancy rate (63% vs 60%) for cycling heifers (RTS 4 and 5) versus heifers that had a RTS of 3.5 prior to the synchronization of estrous program. Pregnancy rates were similar for treated vs non-treated heifers for 30 days in trials 1 and 3. There was a significant difference in percent pregnancy rate ($P < .05$) for the treated vs non-treated heifers (90% vs 78%) in trial 2 by 30 days. This difference may have been partially due to the sex sorted semen that was used during the synchronized period. It might also be noted that the heifers in trial 2 were the youngest at the start of pretreatment and breeding (10.9 and 13.7 average months of age).

TABLE 4. PERCENT OF HEIFERS BY REPRODUCTIVE TRACT SCORES 32 DAYS BEFORE BREEDING

Trial No.	Fed .5 mg MGA/hd Daily	No. Head	Percent Heifers by Reproductive Tract Score					
			1.5	2	2.5	3	3.5 ^a	4 and 5 ^b
1	Pre-treated	50	-	-	-	14	16	70
	Non-treated	51	-	4	-	22	22	52
2	Pre-treated	82	-	-	6	46	31	17
	Non-treated	84	1	-	10	68	13	8
3	Pre-treated	50	-	-	6	36	42	16
	Non-treated	49	4	-	12	65	8	10

^a Near cycling

^b Cycling

TABLE 5. PREGNANCY RATE FOR FIVE DAY SYNCHRONIZED BREEDING PERIOD BY RTS 32 DAYS BEFORE BREEDING FOR ALL HEIFERS

RTS ¹	Total No. of Heifers	Pregnancy Rate 5 day Synchronized Breeding	
		No.	%
4 & 5	96	60	63
3.5	80	48	60
3	163	59	36
2.5	22	3	14
2	4	-	-
1.5	1	-	-

¹ 4 & 5 cycling, 3.5 non-cycling, 2.5 & 3 not cycling and 1, 1.5 & 2 immature.

From these results, feeding .5 mg of MGA/hd daily for 7 to 9 days at approximately 60 to 80 days prior to breeding will increase the number of heifers cycling or near cycling before a synchronized breeding season. The pregnancy rate should be improved slightly for this period. This treatment is not a cure all and one must still take into consideration the heifers average age, weight and body condition score before pre-treating with MGA.

TABLE 6. PREGNANCY RATE FOR PRE-TREATED VS NON-TREATED YEARLING HEIFERS

Trial No.	Treatment	No. Head	Observed in Estrous		Pregnant Synchronized Period		Pregnant 30 days	
			No.	%	No.	%	No.	%
1	MGA	50	37	74	26	52	34	68
	No-MGA	51	43	84	33	65*	37	72
2	MGA	82	60	73	34	41	74	90**
	No-MGA	84	58	69	31	37	66	78
3	MGA	50	33	66	27	54	38	76
	No-MGA	49	30	61	19	39*	37	76

FEEDLOT PERFORMANCE OF RESEARCH CENTER STEERS AND HEIFERS

David W. Schafer and Kristin R. Goff

San Juan Basin Research Center
Colorado State University Agricultural Experiment Station

Introduction

The 1996 calf crop was evaluated at weaning. Bull calves with above average performance were placed in the annual Four Corners Bull Test. The remaining bull calves were castrated. Five steer calves from two different sire groups for a total of ten head were placed in the Great Western Expo in Akron, Colorado. The remaining 113 head of steers were sorted by weight and the heaviest 73 steers were sent to the Navajo Agricultural Products Industry (NAPI) Feedyard in March, 1997 and the remaining 40 were kept at the Research Center, placed on grass for the summer and placed in the NAPI Feedyard in November, 1997.

The majority of the SJBRC heifer calves were retained as replacement heifers. However, there were 21 heifers that were not of replacement heifer quality and they were placed on grass for the summer. In November, 1997, 19 open replacement heifers were added to the group and they were all sent to the NAPI Feedyard.

Carcass information was obtained on all the cattle through the Cattlemen's Carcass Data Collection Service.

Materials and Methods

Expo Steers: Ten System 1 steers representing two sires were sent to the Great Western Expo in Akron, Colorado on November 11, 1996. The steers were weighed and placed on to the 156 day test December 3 following a 21 day warm-up period. The steers were weighed off test on May 8, 1997, marketed and carcass information was collected on May 14, 1997.

NAPI Steers (Group 1): Seventy-three steers were delivered to the NAPI feedlot February 28, 1997. The steers were implanted with Synovex and fed for 160 days. A growing ration was fed until the group averaged 700 pounds and then they were placed on a finishing ration of high moisture corn. Two steers died due to respiratory problems. The remaining 71 steers were shipped August 7, 1997 to the National Beef Cattle Procurement plant, Garden City, Kansas.

NAPI Steers and Heifers (Group 2): Forty steers and 40 heifers were delivered to NAPI feedlot November 3, 1997. The cattle were fed a finishing ration for high moisture corn for 111 days. One steer died from brisket disease. Both groups were shipped on February 22, 1998 to Sunland Beef Packing Plant, Phoenix, Arizona.

Results

Expo Steers: The Expo steer feedlot performance and carcass information is summarized in Tables 1 and 2. Both sire groups performed well during the 156 day test. The System 1 933478 sire group received three awards including 3rd in the overall division for average daily carcass gain, 1st in miscellaneous composite division for average daily carcass gain and net return. The System 1 933448 sire group received 1st in the miscellaneous composite division for carcass price per pound .

System 1 / 933478	5	800	13.7	0.45	1.5	2.57	SELECT +	1.016

NAPI Steers (Group 1): Feedlot and carcass results for the Group 1 NAPI steers are presented in Table 3. The entire group gained 4.29 pounds per day and graded 23% choice and 67% select. The 71 steers went into the feedlot averaging 625 pounds and finished at 1311 pounds in 160 days. The feed efficiency for the group was 5.29 on a dry matter basis. The cost of gain for the group of steers was \$50.00 per 100 pounds. The steers were valued at 73.50 cents per pound going into the feedlot and sold for 66.65 cents showing a net profit of \$84.44 per steer.

NAPI Steers & Heifers (Group 2): Feedlot performance results for the Group 2 NAPI steers and heifers are presented in Table 4. We were unsuccessful in our attempt to collect carcass information on these two groups of cattle. The steers averaged 4.11 pounds per day. The feed efficiency for the steers was 6.05 on a dry matter basis. The cost of gain for the steers was \$53.65 per 100 pounds. The steers were valued at 75 cents per pound going into the feedlot and sold for 63 cents resulting in a net loss of \$40.10 per animal.

The heifers averaged 3.58 pounds per day. The feed efficiency for the heifers was 6.70 on a dry matter basis. The cost of gain for the heifers was \$57.64 per 100 pounds. The heifers were valued at 71 cents per pound going into the feedlot and sold for 63 cents resulting in a net loss of \$40.92 per animal.
